FYI

The headlines in the Finnish Press (below) about a shooting rampage by an 18-year old High School student, Pekka-Eric Auvinen. Before killing six students, the head teacher and a nurse, and turning the gun on himself, Auvinen indicated that he "ate SSRI antidepressants" which, he said, made him feel "aggressive."

Auvinen died.

One can only speculate why major news outlets outside of Finland--CNN, Yahoo, Reuters, BBC--failed to report all facts provided by the Finnish sources--including Auvinen's own statements in a video on YouTube about his unsuccessful treatment with SSRIs.

The New York Times quotes itself from a report about a German school shooting rampage in 2002:

"Stunned and grieving, some Europeans have taken to re-examining their societies, fretting that they have lost the communal warmth that once prevailed outside large cities.

Instead, they fear they are leaving their frailest citizens feeling isolated in an indifferent, money-driven marketplace, which is widely described as an American pathology spreading with globalization."

Another "American pathology spreading with globalization" is the irresponsible use of psychotropic drugs--such as the SSRI antidepressants and antipsychotics--that both sweep away self-regulating internal inhibitions while triggering explosive acts of violence and murderous behavior! See astonishing list: <http://www.ssristories.com/index.php>

But for the press to report honestly about the documented dangers posed by these widely prescribed psychoactive drugs might undercut Big Pharma's aggressive "money-driven" marketing--and its advertising expenditures in the news media.
